

There are too many problems with the BPL system to the authorized services to make such a system worthy of consideration. There already exist numerous and viable alternatives to BPL which are considerably superior and provide the same services.

This system is permature and indicates the pervalance of monatary concerns over technically correct considerations. The FCC has been in this area before and seems to have not learned from past experiences of what lax or permature technical concerns can and do in the manner of interference with proper established services. Further, the interference potential to the BPL system is of great concern. Consumers have demonstrated a very high degree of intolerance to the proper and technically correct services that have caused problems with their unlicensed and improper technical devices they have purchased. Examples include interference to television (commonly called TVI), radio (RFI) and audio devices, all of these are caused by shortcuts in proper technical construction. There also exist other technical problems with the BPL system that have not been, and probably never will be properly resolved.
